*Reduction The Clutter By using
Genetic Algorithm*

*By:
Weaam Talaat Ali*

Contents:

1) What is the clutter?

2) Why we must reduce the clutter effects of signals?

3) Explain the proposed technique (Genetic Algorithm) that use to reduce it?

4) benefits

INTRODUCTION

Clutter refers to radio frequency (RF) echoes returned from targets which are uninteresting to the radar operators. Such targets include natural objects such as ground, sea, precipitation (such as rain, snow or hail), sandstorms, animals (especially birds), atmospheric turbulence, and other atmospheric effects, such as ionosphere reflections, meteor trails. Clutter may also be returned from man-made objects such as buildings and, intentionally, by radar countermeasures such as chaff.

Limitations of Pulse Compression

The time sidelobes accompanying the compressed pulse are objectionable since they mask desired targets or create false targets.

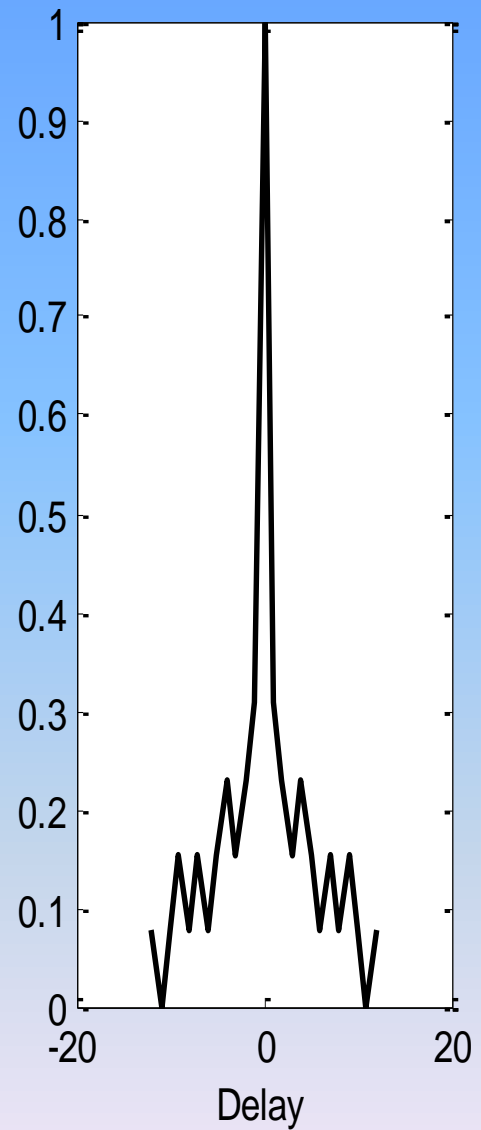

Global Search of any Binary Phase Codes Consist of N bits is:

$$2^N \text{ Sequences}$$

For Example:

For The Code length Consist of 10 bits ,the global Search is $= 2^{10} = 1024$ sequences

Normalized Autocorrelation Output For three sequence of 13 bits

Genetic Algorithm (GA):

- *Genetic algorithm is one of the intelligent computing techniques, So it is a method mainly used to find the global optimization of complex system. It searches from a set of possible solutions in parallel. It uses, the fitness function as a mean of discriminating among different sets of possible solutions. GA is based on generation of new possibly improving population among the previous population.*

Genetic Algorithm (GA):

- *Such reduction is implemented by generation the optimum binary codes with length up to 105 bits, using genetic algorithm (GA) with a minimum peak sidelobe of the aperiodic autocorrelation function for a given length as a criteria.*

Operators of genetic algorithm (GA):

There are three most important parts :

*Roulette
Wheel
Selection*

Crossover

Mutation

Implementation of Crossover operation

Crossover of string binary phase consist of 7-bits

C₁ 1 0 1 0 1 1 1

C₂ 1 0 0 1 0 1 0

Seq 2 1 0 0 1 1 1 1

Seq1 1 0 1 0 0 1 0

For example a single point crossover occurred between 4th

Seq2 1 0 0 1 1 1 1

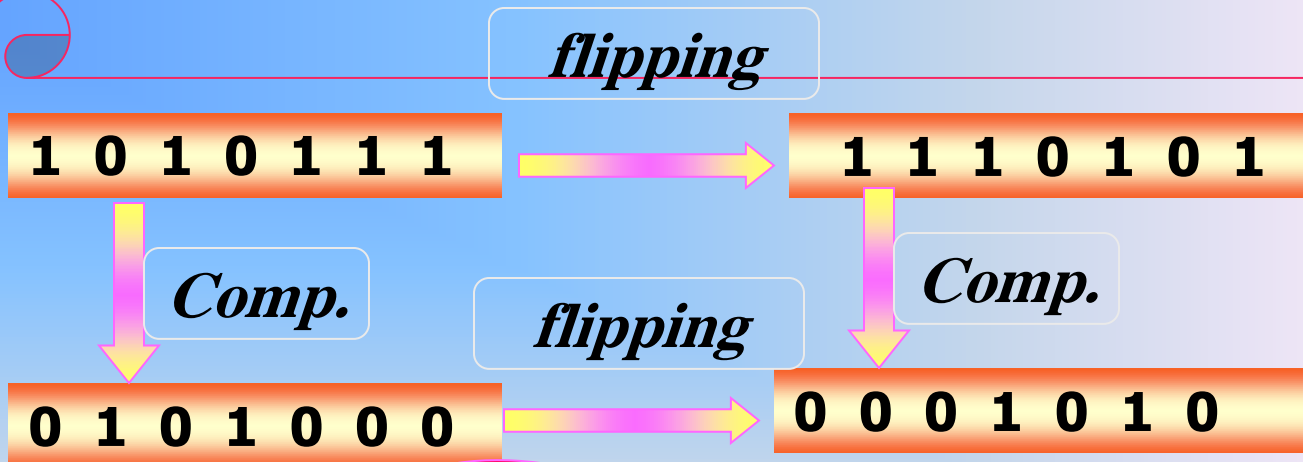

Some Procedure for Reduction Search Space

Eliminating the Allomorphic Forms:

Each binary sequence can be stated in four forms in terms of Autocorrelation Function (ACF), all of which have the same correlation characteristics. So, to reduce the search space must eliminating the three forms of each code.

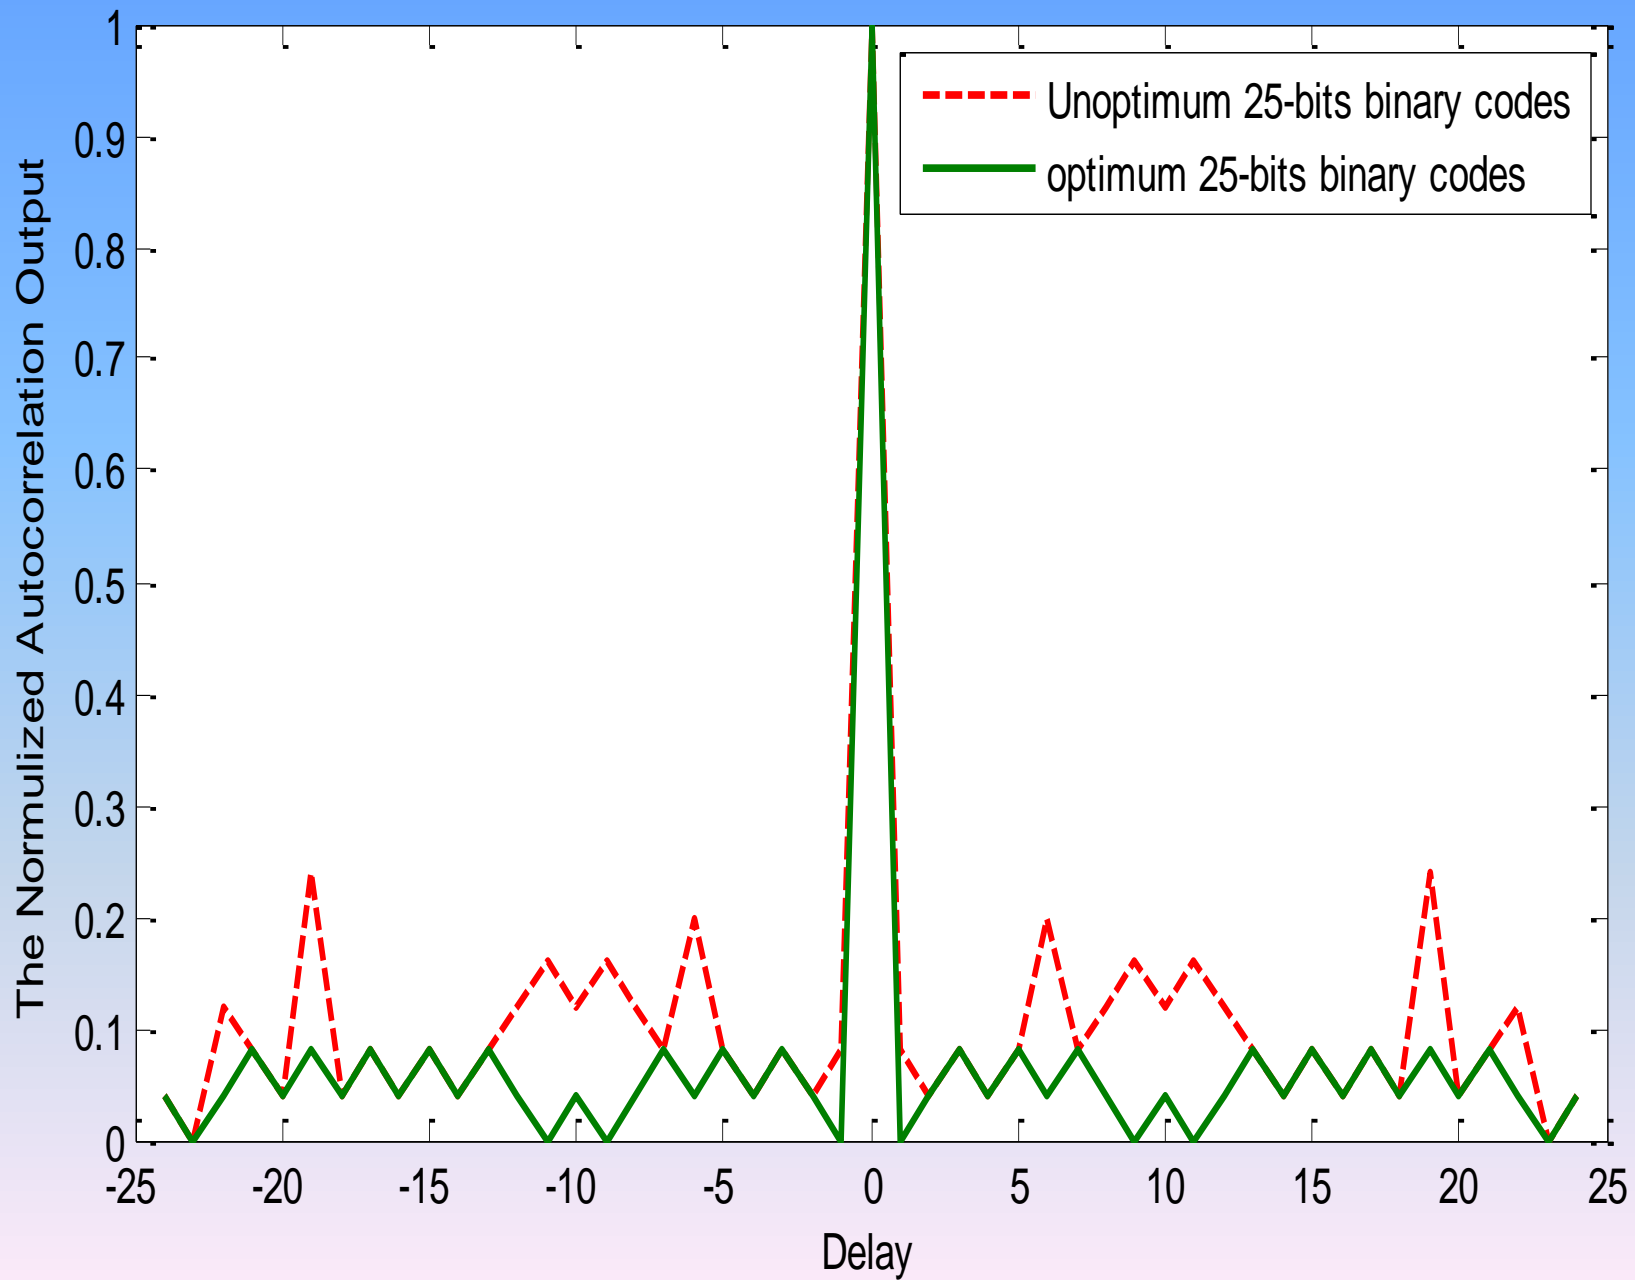

Some Procedure for Reduction Search Space

Eliminating the Allomorphic Forms:

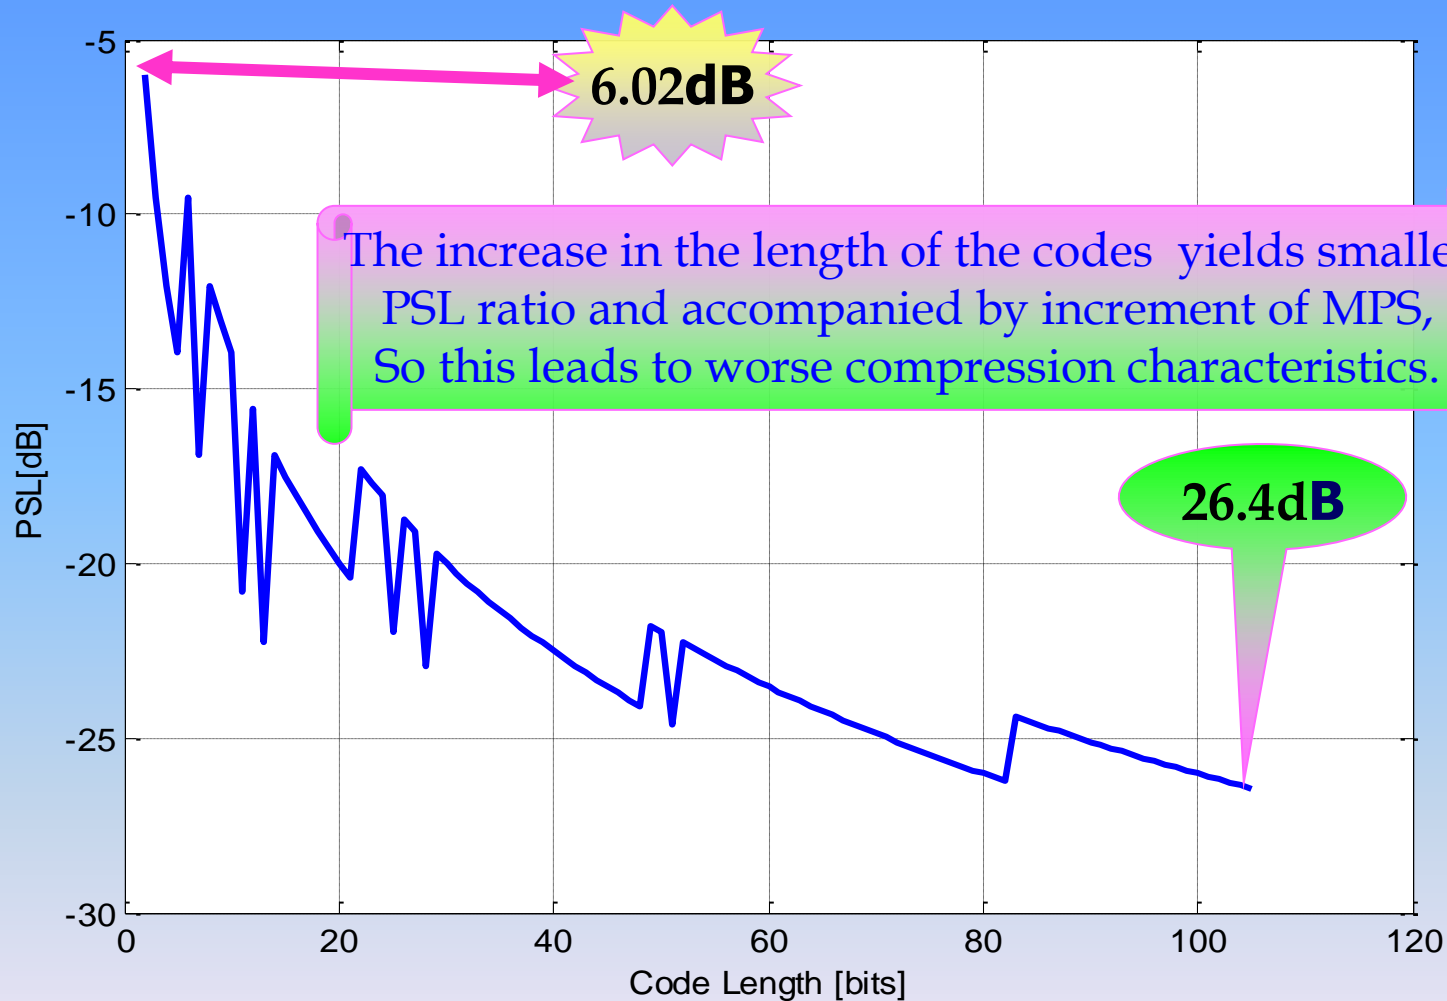

*All of which have the similar
correlation characteristics*
